

Registering your Intuit application

The steps for creating the Intuit developer application that connects your QuickBooks company to your reporting platform.

1 Create an Intuit developer account

At developer.intuit.com, in your own company's name. It is free, and separate from your QuickBooks login even if you use the same email address.

2 Create the application

Scope it to the **QuickBooks Online Accounting API**. Name it after your own company, so that it reads as yours on the consent screen and in the QuickBooks connected-apps list.

Scopes are fixed when the application is created and cannot be changed afterwards. Check the selection before you continue.

3 Provide your App URLs

Host domain, launch URL, disconnect URL, and links to your existing terms and privacy policy. The page has separate **Development** and **Production** tabs holding different values — fill both.

4 Complete Intuit's app assessment

Select your regulated industries first, in Settings; the questionnaire does not open until something is chosen. Choose at least one app category, which is required before production keys are issued. We supply the technical answers about how the integration works.

5

Authorise the connection

Once Intuit issues production keys, your QuickBooks Company Admin authorises the application against the company file and captures the **refresh token** and **realm ID**. Only a Company Admin can do this.

6

Place the credentials in your secret store

Client ID, client secret, refresh token and realm ID are entered directly into your own Google Cloud Secret Manager, which is where the integration reads them from.

Never send a credential by email, chat or shared document. A refresh token is a live key to your ledger until it is revoked.

Two things to know

The integration reads only. It issues queries and never writes to QuickBooks.

You can disconnect it at any time under **Settings → Apps** in QuickBooks. If the connection is left paused for around 101 days the token expires and a Company Admin has to authorise it again.
